

## How to install HARMONICS for macOS

### 1 Install xcode

verified version 10.2

In case of previous versions, please download the following xcode.

<https://itunes.apple.com/jp/app/xcode/id497799835?mt=12>

### 2 Install Qt

verified version 5.10.1

In case of previous versions, please download the following Qt installer.

[http://download.qt.io/official\\_releases/online\\_installers/qt-unified-mac-x64-online.dmg](http://download.qt.io/official_releases/online_installers/qt-unified-mac-x64-online.dmg)

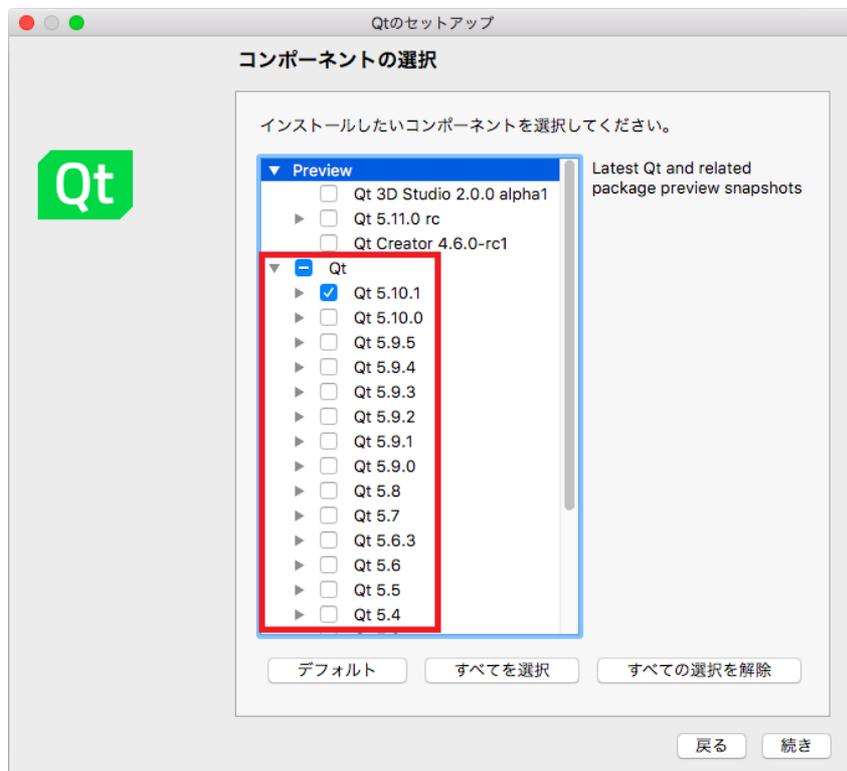

Follow install instructions in the dmg.

#### Notes

Please set appropriate check-box.

When you select installing components, turn on the check-box of Qt 5.10.1.

If you finished without this confirmation, please use Maintenance Tool.app.

### 3 Set up homebrew

Test the following command in a prompt on your terminal.

```
$ which brew
```

In case displaying no setting of path, install the homebrew.

```
$ /usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"
```

Check status of homebrew installation.

```
$ brew doctor
```

Confirm the message "Your system is ready to brew."

Install required libraris by this homebrew.

First carry out the following command and browse the list.

```
$ brew list
```

Note: verified by Imagemagick version 7+ and OpenCV version 4

```
alps-adminnoMacBook-Air:~ demo$ brew list
aom                glib                libheif             numpy               shared-mime-info
```

```

```

If you don't have opencv, ccfits, webp, and sqlite, please install them by the following commands.  
Please type y and enter, if you're asked confirmation of this install.

```
$ brew install cfitsio
```

```
$ brew tap brewsci/science
```

```
$ brew install ccfits
```

```
$ brew install webp
```

```
$ brew install sqlite
```

```
$ brew install curl
```

```
$ brew install imagemagick
```

```
$ brew install opencv
```

#### 4 Install cspice

```
$ brew install cspice
```

If you have any problems, please carry out the following steps.

#### Manual installation of cspice

If you use macports, you cannot install cspice by it. You install cspice manually.

[http://naif.jpl.nasa.gov/pub/naif/toolkit/C/MacIntel\\_OSX\\_AppleC\\_64bit/packages/cspice.tar.Z](http://naif.jpl.nasa.gov/pub/naif/toolkit/C/MacIntel_OSX_AppleC_64bit/packages/cspice.tar.Z)

Uncompress cspice.tar.Z

Carry out the following commands on the uncompressed "cspice" directory.

```
$ sudo cp lib/* /usr/local/lib/
```

```
$ sudo cp include/* /usr/local/include/
```

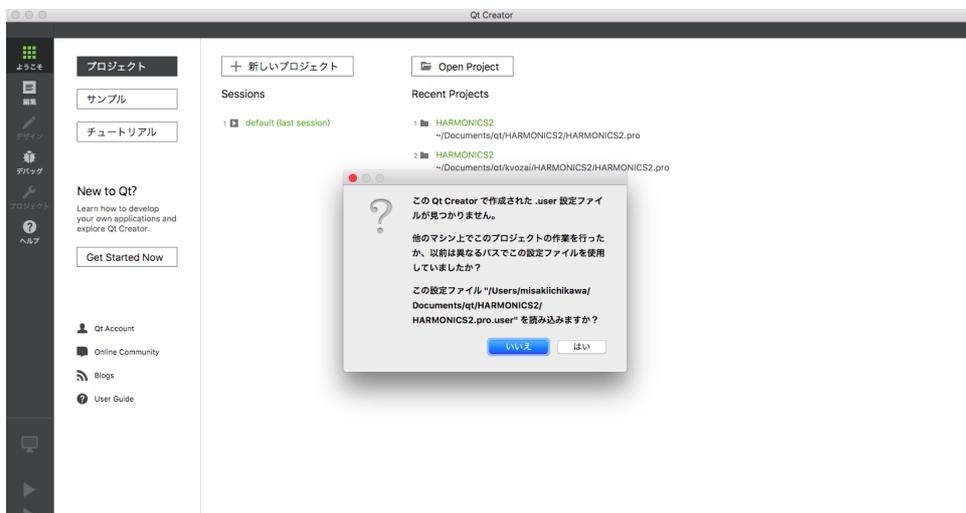

```
$ sudo cp exe/* /usr/local/bin/
```

#### 5 Set up HARMONICS

Carry out HARMONICS2.pro in the project directory.

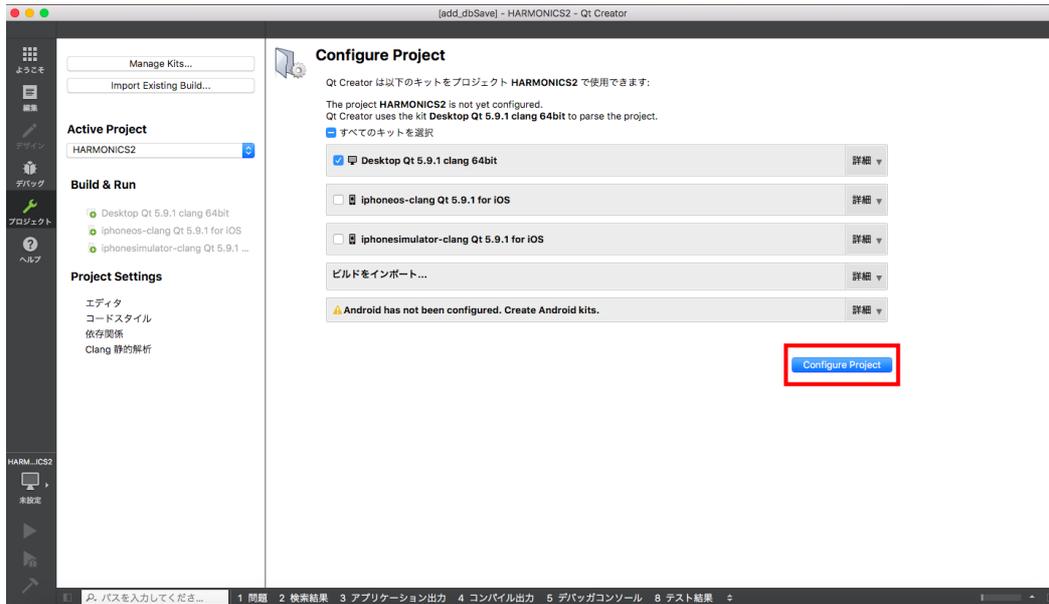

After Qt started, you find the next dialogue.

Please select "No" in the dialogue.

### Select Configure Project

Confirm loading \*.h files and \*.cpp files successfully.

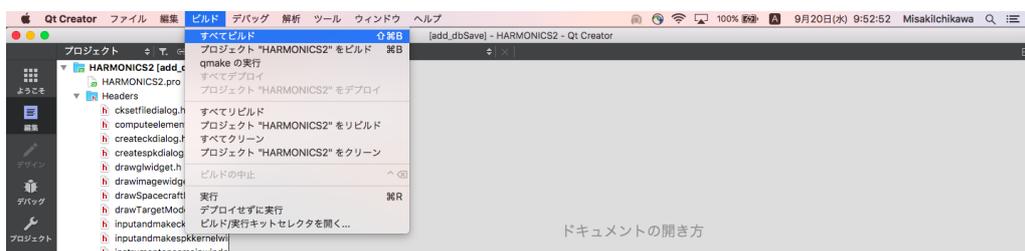

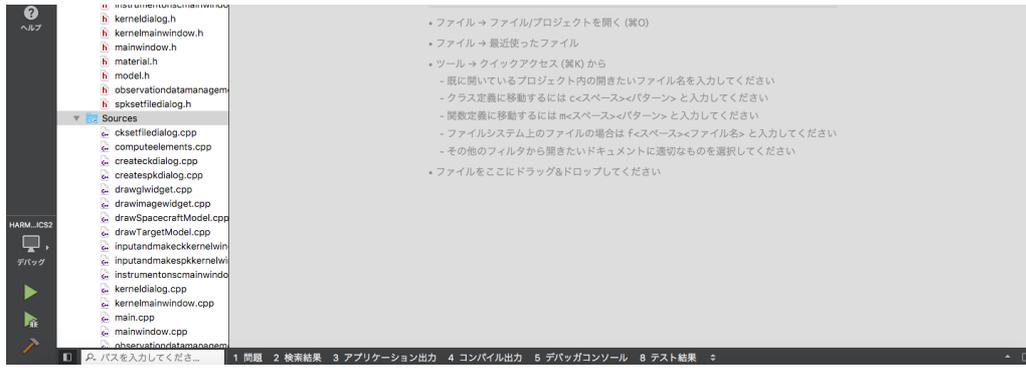

Confirm the following path is written in .pro file.

"LIBS += /usr/local/opt/curl/lib/libcurl.dylib"

Select Build in menu-bar.

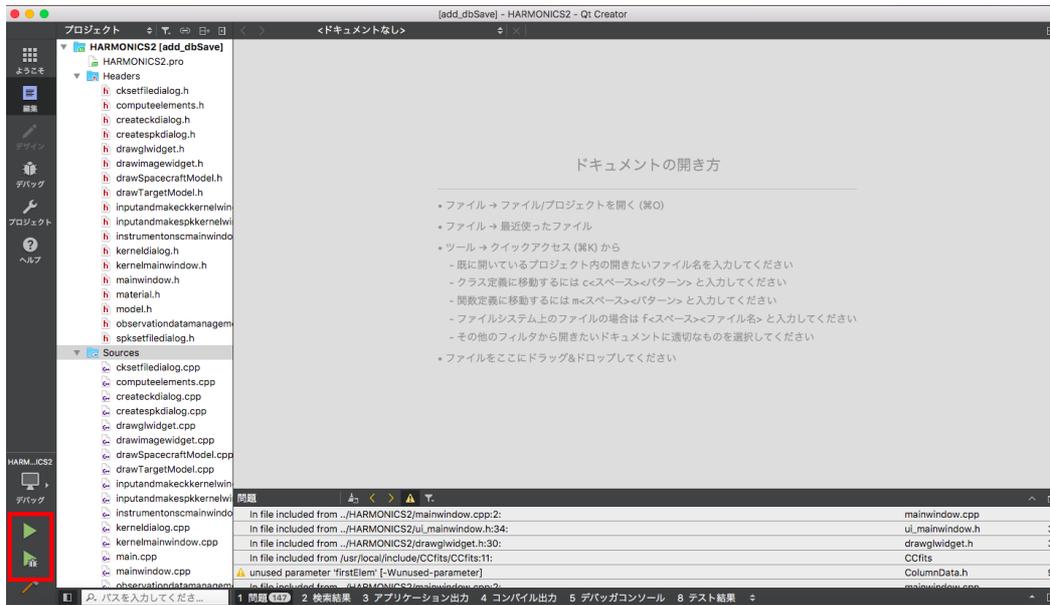

It takes 5-10 min in the first building.

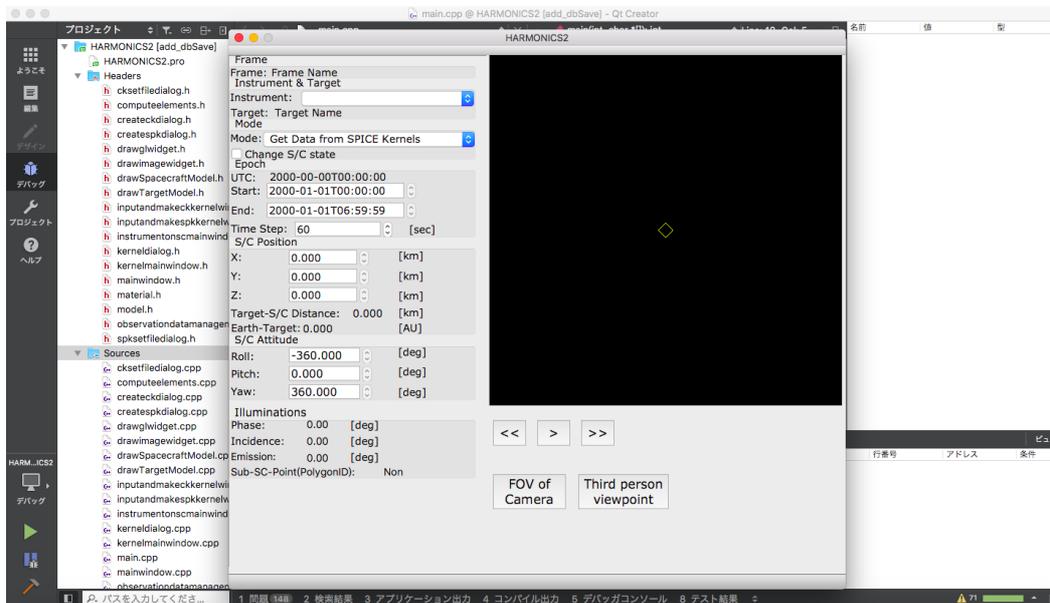

## Start-up HARMONICS

You can select preferable modes.

## Open HARMONICS window

Notes:

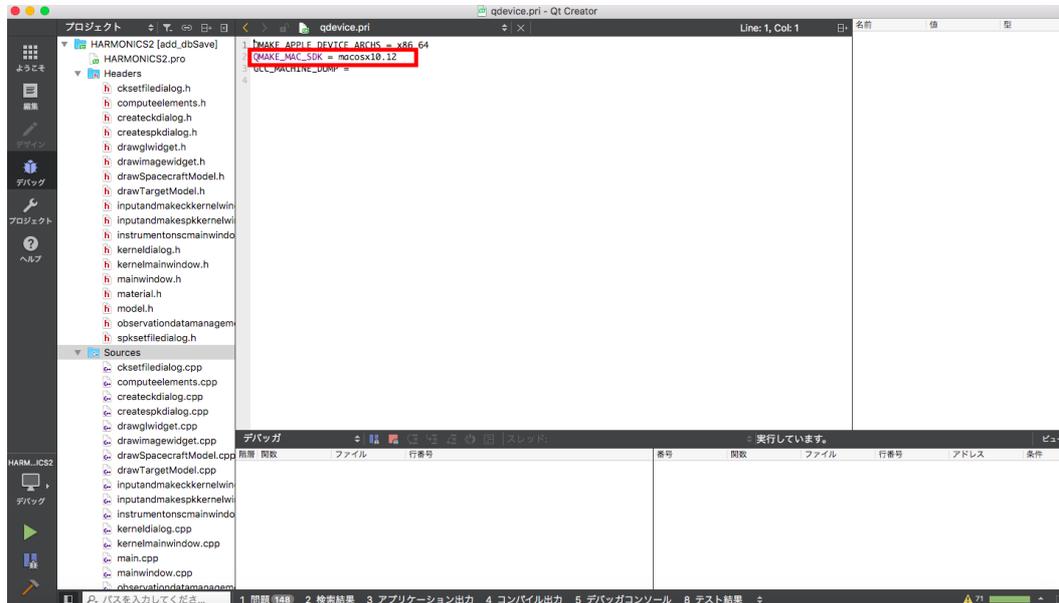

If you have a message "'TargetConditionals.h' file not found", then please edit the following file.  
/Users/Your\_Account~/Qt/5.9.1/clang\_64/mkspecs/qdevice.pri

(Before)

```
QMAKE_MAC_SDK = macosx
```

(After)

```
QMAKE_MAC_SDK = macosx10.13
```

Notes:

Initial status is too far to see the asteroid Itokawa.

You find Itokawa setting start-time as 2005-9-11.

\*\*\*\*\* Error Message in Start-up of HARMONICS \*\*\*\*\*

In case "Project Error: Xcode not set up properly."

Change your current working directory to Qt directory, then carry out the followings.

```
grep -rn /usr/bin/xcrun .
```

Edit "Qt\_Directory/5.x/clang\_64/mkspecs/features/mac/default\_pre.pri"

Change line 14-15 as follows.

(Before)

```
isEmpty($$list($$system("/usr/bin/xcrun -find xcrun 2>/dev/null"))):
```

(After)

```
isEmpty($$list($$system("/usr/bin/xcrun -find xcodebuild 2>/dev/null"))):
```
